# JASH PATEL

Jersey City, NJ | +1 (201) 686-1670 | jash.code8@gmail.com | linkedin.com/in/jashpatel68 | github.com/jash65571

**Authorized to work in the U.S. without current or future employer sponsorship**

## PROFESSIONAL SUMMARY

Software Engineer with 4+ years of experience building, modernizing, and supporting production web, backend, and automation systems. Experienced across Python, PHP/Laravel, JavaScript/TypeScript, React, SQL, REST APIs, Linux, Docker, AWS, and CI/CD. Work includes legacy platform modernization, e-commerce and order workflows, hardware-validation automation, production debugging, API integration, and frontend development.

## TECHNICAL SKILLS

**Languages:** Python, PHP, Java, JavaScript, TypeScript, SQL, Bash, HTML5, CSS3
**Frontend:** React.js, Next.js, Vue.js, Angular / AngularJS, Tailwind CSS, jQuery
**Backend & APIs:** Laravel, Node.js, REST APIs, GraphQL, FedEx APIs, PDFlib
**Databases:** PostgreSQL, MySQL, MariaDB, Redis, query optimization and indexing
**Cloud & DevOps:** AWS, Docker, Jenkins, GitLab CI/CD, Octopus Deploy, Linux
**Systems & Tools:** Git, JIRA, Tkinter, VMware, PXE boot, DHCP, Excel automation

## PROFESSIONAL EXPERIENCE

### **ABC Imaging** | Carlstadt, NJ

***Software Developer*** **| Mar 2025 - Present**

- Modernize EPOD, a production order and workflow platform, from a legacy PHP/jQuery codebase toward PHP/Laravel services and a React frontend, reducing page-load times by 80% and making the interface easier for internal users to work with.
- Refactor legacy order, signage, and work-order logic into REST APIs so frontend and backend concerns are easier to separate, production fixes are easier to isolate, and new features can be added without extending tightly coupled legacy flows.
- Build and maintain FotoPrint, ABC2, DryInk, and related internal applications that support photo, signage, packaging, and order-processing workflows used by internal teams and enterprise customers.
- Implement shipping, packaging, and billing logic using FedEx APIs, dynamic packaging rules, and application-side validation, reducing manual corrections in affected workflows by 90%.
- Create Docker images and Jenkins deployment pipelines for EPOD and related applications running on AWS, reducing deployment errors by 35% and making releases more repeatable across environments.
- Investigate production defects across frontend, backend, database, and deployment layers; trace failures through application behavior and logs, implement fixes, and validate changes before release.
- Review teammates' PHP and Java changes, help debug production issues, and apply reusable design patterns when refactoring older code to improve maintainability and reduce repeated logic.

### **ZT Systems** | Jersey City, NJ

***Software Developer*** **| Aug 2023 - Aug 2024**

- Build Python validation tools that inspect hardware and build data before test execution, catching setup problems earlier and saving more than 10 hours of manual checking each week.
- Automate collection of logs from Linux servers and correlate those logs with build records, giving engineering and factory teams a faster way to narrow down hardware and production failures.
- Develop a lightweight Tkinter desktop interface around Python validation workflows so operators can run repeatable checks without needing command-line knowledge.
- Run and validate operating-system image tests through PXE infrastructure and VMware hosts before release, helping confirm that builds and deployment images behave correctly in the target environment.
- Work directly with factory and engineering teams to troubleshoot DHCP, networking, BIOS, and system-configuration issues that block or slow test runs, then verify fixes against the affected workflow.

### **Savvology Games** | Jersey City, NJ

***Frontend Developer*** **| Jan 2020 - Mar 2023**

- Build game screens, user dashboards, and interactive web interfaces using React, Next.js, Angular, TypeScript, Tailwind CSS, and GraphQL across multiple product features.
- Translate product and design requirements into reusable frontend components, creating shared UI building blocks that were reused across three game features and reduced duplicate implementation work.
- Improve page performance by reducing unnecessary API requests, simplifying client-side data flows, and moving heavier processing to backend services when work did not need to run in the browser.
- Partner with backend engineers to debug API failures, reconcile mismatched request and response formats, and make frontend integrations more reliable as backend contracts changed.
- Add client-side error handling and lightweight caching around game and dashboard flows to reduce failed sessions and avoid repeated requests for data that could be reused safely.

## EDUCATION

**University of Mumbai** | Bachelor's, Computer Engineering | 2019 - 2022
**University of Mumbai** | Associate's, Computer Engineering | 2014 - 2019
